

Is Indonesia's energy transition progress stalled in 2024?

Jakarta, December 5, 2024 - The progress of Indonesia's energy transition throughout 2024 has stalled. The government's move to revise the National Energy Policy has actually lowered the target for achieving renewable energy from 23% to 17-19 percent in 2025. Indonesia's energy transition status has not moved from the consolidation stage.

Will Indonesia see a boom in renewables?

Indonesia has not yet seen a boom in renewables, resulting in fossil fuels meeting its electricity demand growth. The National Energy Policy (NEP) 2014 set a target of 23% of renewables in the energy mix by 2025, however, this target is likely to be reduced to between 17-19% in the revised NEP currently being developed.

How will Indonesia's New NEP affect the energy sector?

The revised NEP, expected to be released this year, will reduce the renewable energy target from 23% by 2025 to between 17-19% in the energy mix. As a result, Indonesia's climate commitments in the energy sector may progress slower than previously anticipated.

Will Indonesia's energy transition be a good idea?

Evidence suggests that Indonesia's energy transition should be well under way. The government has set a target to support renewable energy development in the New Energy and Renewable Energy Bill through increasing on-grid renewable capacity, converting diesel power generation to solar and expanding rooftop solar.

Will Indonesia achieve net zero by 2025?

In 2023, more than 30% of the world's energy came from renewable sources, the first time that threshold has been broken. As part of its contribution toward achieving net zero, Indonesia has set a target to increase its share of renewables to 23% of the national energy mix by 2025.

Can Indonesia achieve net-zero emissions by 2050?

Pathways to achieve net-zero emissions by 2050 are explored. EnergyPLAN and MultiNode simulations are employed to analyse three scenarios. Indonesia's energy system is segmented into five regional systems. A detailed future energy demand analysis is presented. Results identify electricity as the primary backbone of future energy systems.
