How much does a microgrid cost?

Microgrids are complex systems that require specialized skills to operate and maintain. Microgrids include controls and communication systems that contain cybersecurity risks. A 2018 study conducted by the National Renewable Energy Laboratory found that microgrids in the Continental U.S. cost an average of \$2 million-\$5 million per megawatt.

What percentage of total microgrid costs are controller costs?

3.2). Controller costs as a percentage of total costs range from 0.5%-21%, a median of 7%, and one outlier with a value of 56% (Figure 20.). The analysis shows that controller cost data as a percentage of total microgrid costs have a wide range of costs among the projects in our database.

Are microgrids a good investment?

Microgrids that incorporate renewable energy resources can have environmental benefits in terms of reduced greenhouse gas emissions and air pollutants. In some cases, microgrids can sell power back to the grid during normal operations. Depending on the complexity, microgrids can have high upfront capital costs.

Where can I find a report on microgrid costs?

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at Giraldez, Julieta, Francisco Flores-Espino, Sara MacAlpine, and Peter Asmus. 2018. Phase I Microgrid Cost Study: Data Collection and Analysis of Microgrid Costs in the United States.

What is a microgrid control system?

Microgrid control systems: typically, microgrids are managed through a central controller that coordinates distributed energy resources, balances electrical loads, and is responsible for disconnection and reconnection of the microgrid to the main grid. Load: the amount of electricity consumed by customers.

How much does energy storage cost a microgrid?

In commercial/industrial and utility microgrids, soft costs (43% and 24%, respectively) represent significant portion of the total costs per megawatt. Finally, energy storage contributes significantly to the total cost of commercial and community microgrids, which have percentages of 25% and 15%, respectively, of the total costs per megawatt.
