To wire your solar panels in series, simply link the positive MC4 connector of the first solar panel to the negative MC4 connector of the next one, and continue this pattern for the remaining panels. Once you're finished, you'll have two unconnected terminals at each end of your series--a positive and a negative.

However, as a solar professional, it's still important to have an understanding of the rules that guide string sizing. Code Compliance and Site-Specific Design. Each solar project is unique, and the wiring diagram must be customized to meet the specific requirements of the AHJ and the site conditions. This includes designing the system to comply with local electrical codes and including a site map showing the locations of all equipment, such as panels, inverters, and disconnects.

The most practical wire for solar panels is PV1-F solar cable, this cable is most common in 4mm² and 6mm². A very rough rule of thumb is for arrays of less than 20A can use 4mm², and 20A or larger should use 6mm². If a larger size is required, it is recommended to run two runs from the array to the solar controller. ...
