

# The solar system contains about 100 billion stars

Take a journey through the Milky Way galaxy, exploring the wonders of our solar system and the distant stars that illuminate the night sky. The Milky Way is home to over 100 billion stars, each ...

The largest known galaxy (IC 1011) contains more than 100 trillion stars. Other large galaxies have around 1 trillion stars. Small galaxies are called dwarf galaxies and contain roughly 10 billion stars. Many scientists believe ...

Astronomers estimate our galaxy, the Milky Way, contains about 100 billion stars. And the observable universe holds at least 100 billion galaxies, each with its own vast collection of stars.

The matter of the solar system, all added together, contains about  $10^{57}$  atoms, which means there are  $10^{29}$  "human atoms" in the solar system. So an atom is compared to a human ...

While we've taken giant leaps across our own solar system, the stars remain unimaginably distant. Our galaxy alone spans 100,000 light-years, and the observable universe stretches over 12 billion ...

Solar system - Planets, Moons, Orbits: The eight planets can be divided into two distinct categories on the basis of their densities (mass per unit volume). The four inner, or terrestrial, planets--Mercury, Venus, Earth, and Mars--have rocky ...

The solar system is situated within the Orion-Cygnus Arm of the Milky Way Galaxy. Alpha Centauri, made up of the stars Proxima Centauri, Alpha Centauri A, and Alpha Centauri B, is the closest star system to the solar ...

Along with its neighbor Neptune, Uranus is one of two ice giants of the Solar System. In fact, Uranus is a ball of gas and ice. Formation of Uranus Uranus formed about 4.5 billion years ago when the rest of the Solar System ...
